IMI Pneumatex: 110+ years of innovation

Founded in 1909 in Basel, Switzerland, IMI Pneumatex has been a true pioneer in the pressurization market, developing products that remain market-leading technologies to this day; including the first-ever closed expansion system that was built in 1955.

WATCH THE VIDEO

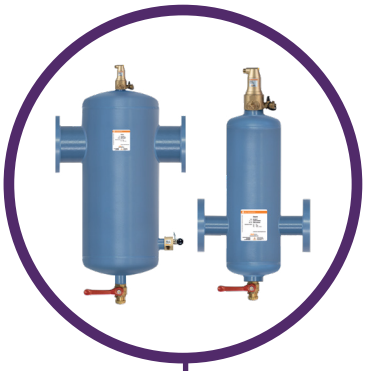
Customer-driven innovation

For over 110 years, IMI Pneumatex has never swayed from its belief that prevention is better than cure, which is why we strive to develop groundbreaking solutions and superior technologies that keep HVAC systems free of gas, dirt, and sludge, thus ensuring long service life, durability, and effective pressure control. However, innovation for innovation's sake is not what we're about. Everything we do is driven by real-world needs, and every solution we design is intended to help solve the challenges you face, be it space savings, energy efficiency or remote connectivity, bringing peace of mind for you and your customers.

A history in Innovation



2024
Zeparo Cyclone Max & Zeparo Aero
Working at any flows and pipe sizes

"The 'Swiss-made' stamp highlights the seriousness of the manufacturing and the attention paid to ensure the highest quality of the products."

The 1st vacuum degaser

The pressure maintenance product range

Our pressurization devices are made from the highest-grade materials in our state-of-the-art factories so you can expect quality, reliability and performance – whatever the application.

"IMI Pneumatex offers a series of vessels shapes and sizes that are practical, durable and suitable for any system's needs. Some of our partners have several old IMI Pneumatex installations from the 1980s that are still functioning perfectly."

Lajos Vágó, Hungary

System type	Fixed air cushion systems	Dynamic air cushion systems with compressors		Dynamic air cushion systems with pumps		
	One of the most popular and effective solutions in the **lower performance range** thanks to its brilliantly simple design, robust construction and operation without auxiliary power.	Ideal for **medium-sized applications** with heating systems where high precision and compactness are essential, optimal pressure is maintained by a compressor and overflow valve.		Predominantly designed for **medium-sized applications** where optimal pressure is maintained by a pump and overflow valve. Some of the products are suitable for **large-sized applications** from 40 Mw and even up to 160 Mw.

*with temperature protection

Why is pressurisation so important?

Effective pressurisation control is essential to ensure optimal system performance and protection of components to safeguard their lifespan.

Find out more on how temperature changes impact the pressure in the system and how our solutions compensate those changes to keep all elements of this system in a perfect shape for many decades to come.

WATCH THE VIDEO

Learn how pressurisation systems work.

The incompressible media contained in heating, solar and cooling water systems expands and contracts as temperatures fluctuate, leading to changes in volume.

When **temperature rises**, system media expands, pressure builds up and the subsequent strain on individual components can lead to rupture and failure.

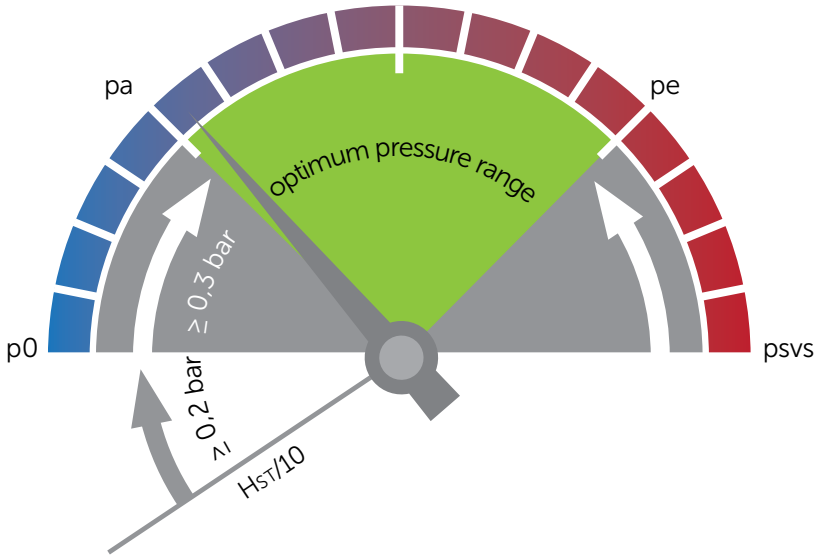
When **temperature decreases**, the volume reduces and the drop in pressure can lead to air intake that causes corrosion, the biggest enemy of water-based HVAC installations.

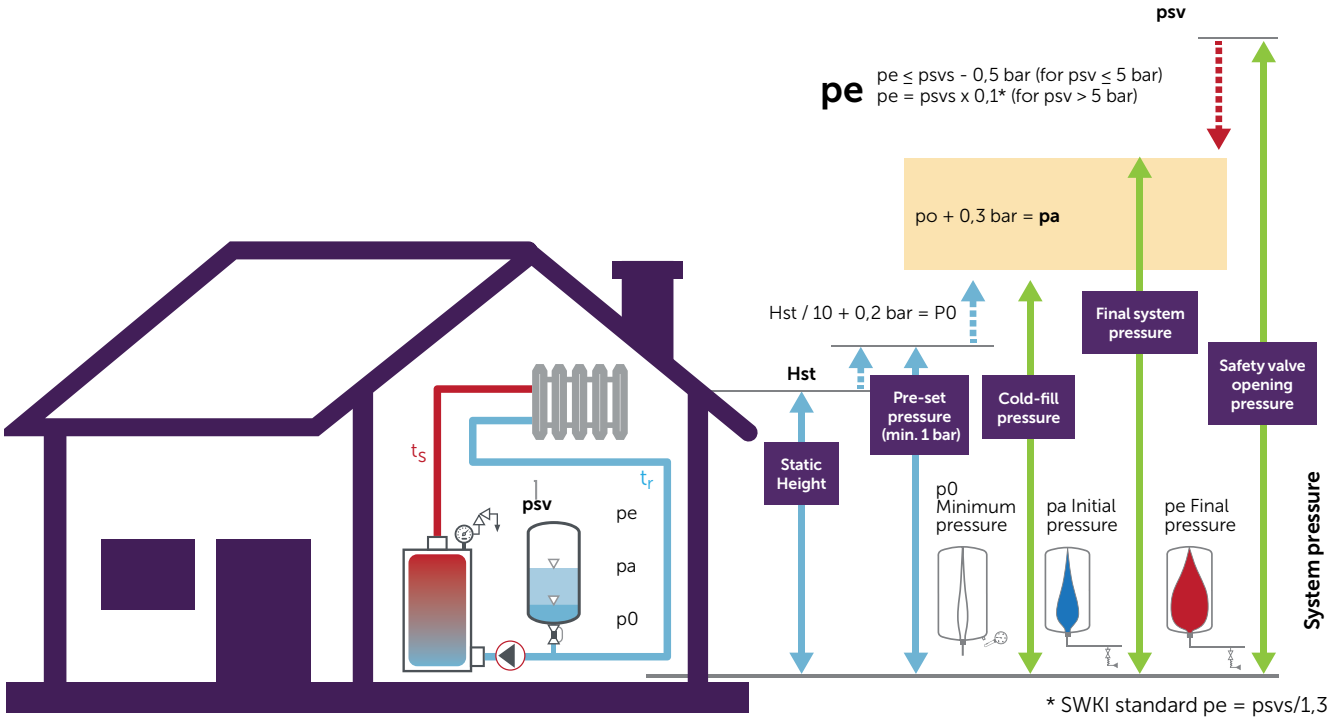
Therefore, **sub-optimal pressurisation can damage components like pumps, as well as causing leaks and corrosion that undermine performance and system longevity**.

This is why it is essential to invest in a high quality pressurisation system that is adapted to the specific needs of your application.

Our innovative and high-performing range of pressurisation solutions automatically compensate for changes in pressure caused by temperature fluctuations and consistently maintain optimal system pressure.

This will eliminate the aforementioned problems (leaks and corrosion) and will help protect system components to **deliver years of trouble-free, cost-effective HVAC performance**.





The water quality product range

Our water quality products have been designed to safeguard your systems health thanks to innovative engineering and high-quality materials. So you can fulfill any project requirement to the highest standards.

"The strong point about IMI Pneumatex is reliability: you don't have to worry about the product once it is installed."

Bruno Champmartin, France

Why is air and dirt separation so important?

Managing the water quality inside your HVAC system through the removal of air and dirt is an effective way to extend the lifetime of critical system elements while optimizing system performance.

WATCH THE VIDEO

Learn more about different appearances of gas in liquid.

The benefits of good water quality management are:

- Reduced energy use
- Prolonged system service life
- Quiet operation
- No downtime

The quality of system water has a profound impact on the service life and efficiency of heating, solar, and cooling water systems. The nature and frequency of complaints may vary depending on the type and age of an installation, **but corrosion caused by air and sludge in the water circuit visibly accelerates wear in system components.**

This leads to recurrent complaints and expensive repairs, resulting in high costs and a growing sense of dissatisfaction among users and installers alike.

Reliable water quality in HVAC systems facilitates fault-free operation. The fewer impurities in the water circuit, the more stable the heat distribution.

This makes the entire system less prone to corrosion and minimises component failure rates as well. Efficient separation technology can optimise maintenance costs and prolong system service life. Flow noise, gurgling radiators and reduced heat output all become a thing of the past, and clogged fittings, valves and pumps, even leaks, can be prevented.

Our specialised production process means you can depend on quality, reliability and high performance – in every application.

Examples of system damage linked to water quality issues

Types of applications

From residential projects to large-scale commercial installations, IMI Pneumatex has the right solution for all your water quality and pressure maintenance needs.

An ideal water quality or pressurisation solution conforms to all specific requirements, whether for sizing, heating loads, or static pressure. This simple product selection chart below helps you determine which solution is most suitable for your project.

"The installation of a Pneumatex product is beneficial for the customer, the installer, and the designer alike."

Alvaro Blasco, Spain

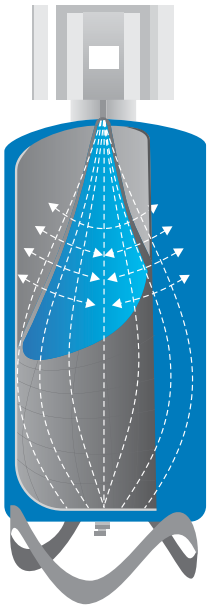
The Butyl Bag

Pioneering performance technology for enhanced vessel performance.

The heart of expansion vessel is the key to its reliable performance. Our expansion vessels stand out due to their innovative design featuring a specialised bag. Unlike conventional membrane vessels, **our innovative design ensures that water never touches the metal walls of the vessel, thus guaranteeing superior durability and long-term performance.**



Our bag, made of butyl rubber, has the market's lowest air diffusion rate, surpassing any other comparable membrane material by 5 to 10 times. This feature ensures that the initial pressure remains unaffected, contributing to optimum performance over time. In contrast, most expansion vessels on the market use a membrane made of rubber that is **not based on butyl** and therefore less resistant to diffusion.

Additionally, the diffusion rate increases exponentially with rising temperature. Materials with already high diffusion rates quickly reach a noticeably significant diffusion. As a result, these vessels struggle to maintain the correct static pressure over time.

WATCH THE VIDEO

Learn about butyl bag outstanding resistance.

"We always use products equipped with the Butyl Bag because it delivers a standard of quality that is consistent with our company's philosophy"

René Savaris, Switzerland

The legendary diffusion-proof butyl bag in IMI Pneumatex vessels redefines quality standards.

Why our Butyl Bag stands out from the rest:

High-quality: Our vulcanised bags are constructed from top-quality butyl rubber with exceptional diffusion resistance, ensuring long-lasting performance.

Design optimisation: The two-fold attached butyl bag is designed for an approximate nominal volume, preventing over-expansion and minimising wear over time.

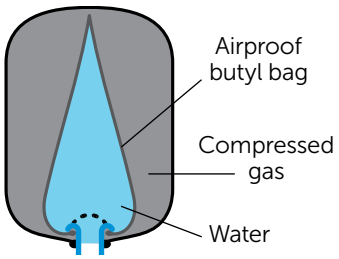
Corrosion prevention: Water is securely contained within the butyl bag, eliminating any contact with the vessel wall and protecting against corrosion. This design leads to a longer service life and eliminates costs associated with premature replacements.

Minimal operational costs: Our butyl bags offer reliable and nearly maintenance-free operation at stable preset pressures, minimising operational expenses.

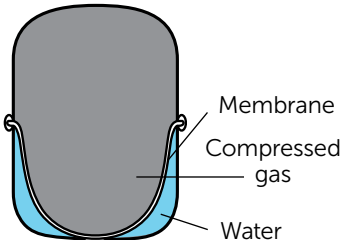
Double protection: The butyl bag ensures dual protection, safeguarding not only the vessel but also the entire system, eliminating consequential costs due to corrosion.

Outstanding performance: In tests involving several manufacturers, IMI Pneumatex outperformed competitors, as demonstrated by minimal primary pressure loss (see chart below), the elimination of the need for initial overpressure, and the absence of residual water inclusion.

IMI Pneumatex vessel



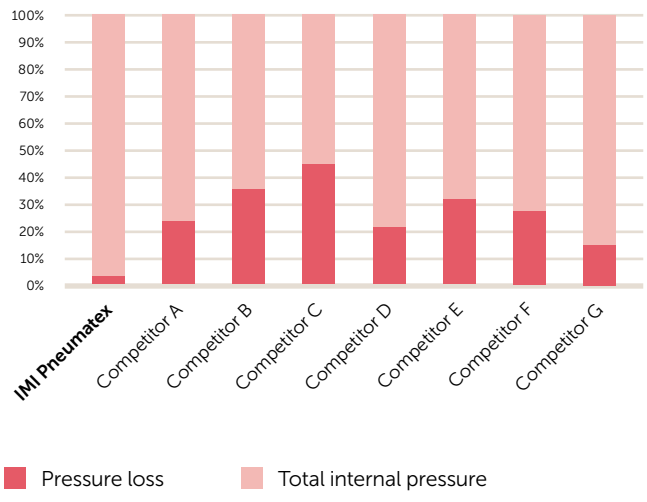
Conventional vessel



Proof of performance

An independent study conducted by a Belgium institute tested the pre-pressure loss of eight expansion vessels over one year of operation.

The graph illustrates how the IMI Pneumatex vessel equipped with Butyl Bag was at least 5 times more efficient at maintaining optional pressure than any other expansion vessel tested.



Source: The Karel de Grote-Home-school in Belgium carried out a quality comparison with expansion vessels.

BrainCube Connect

BrainCube Connect is the universal control unit of all Pneumatex TecBoxes to help you stay in control any time, anywhere.

The BrainCube enables simplified access to essential system information via any connected device. So, you can **enter settings, change system values, access logging data** for system performance monitoring and even troubleshoot the system whether you are on or off site. For **maximum security projects** where data cannot leave the premises, the **cloud connection can be disabled**. System information can be accessed through the BrainCube touchscreen.

WATCH THE VIDEO

Learn more about BrainCube Connect: intelligent, intuitive control unit.

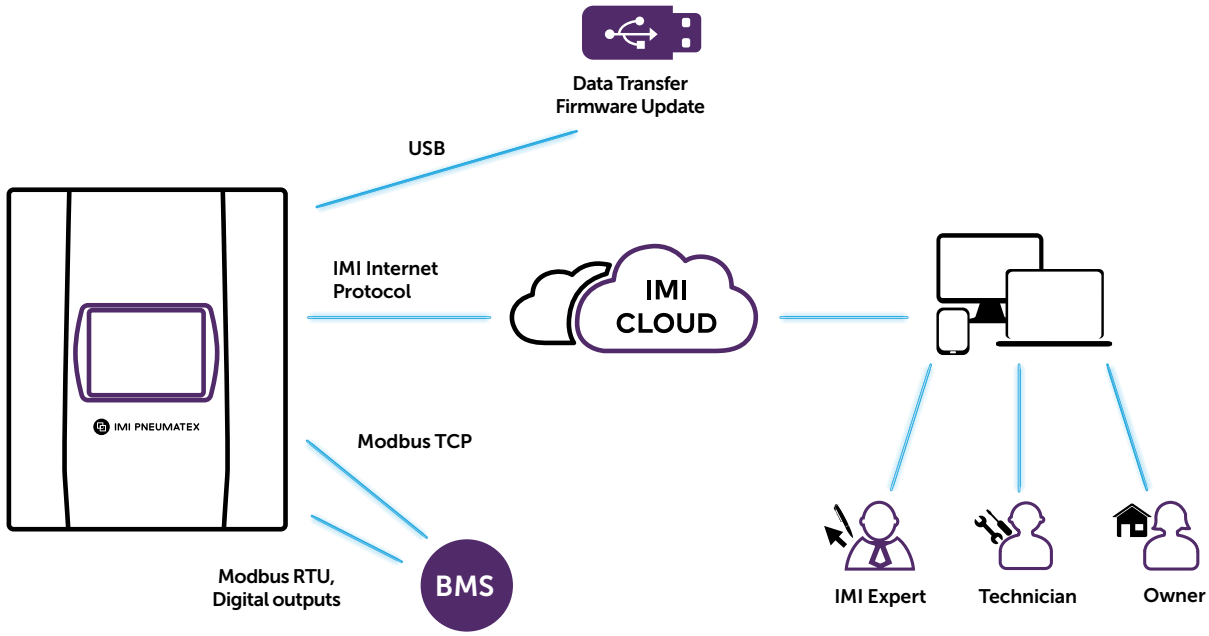
Seamless Integration

BrainCube Connect integrates with Building Management Systems via standardized Modbus protocol on RS485 (RTU) and Ethernet (TCP-IP), ready to be converted to other standards (such as KNX and BACnet).

Direct on-site connection via USB and Ethernet with the IMI Hydronic Web-Interface Cloud solution **to give you total visibility and control.**

Connected interface

The illustration below shows the communication versatility of the BrainCube Connect. If a system fault is detected, an alert will be sent directly to the customer who can view the message on their smartphone, access system settings, make adjustments or call for service before the problem gets worse.



Remote Connection RS485

Thanks to the RS485 port you can easily connect your device to the BMS system and fully control your system.
- Direct communication with BMS via Modbus RTU
- Communication with KNX, BACnet or other networks via suitable external modules

Service Connection USB

The USB port provides a quick and reliable connection on-site for service purpose.
- Off-line update of firmware
- Data transfer from BrainCube (history, messages) or upload of new settings.

Plug & Play Connection Ethernet

Easy connection to your BMS system and/or to IMI Cloud Web-Interface via router or GSM gate.
- Direct communication with BMS via Modbus TCP
- Communication with KNX, BACnet or other networks via suitable external modules
- Plug & play connection with the IMI Hydronic Web-Interface Cloud solution
- BrainCube to BrainCube communication (e.g., in Master-Slave pressurisation networks and external water make-up function)

BrainCube Connect Master-Slave functionalities

In installations where more than one pressure maintenance system is employed or multiple installations are hydraulically connected, a master-slave combined operation becomes essential. In such scenarios, effective communication between pressure maintenance devices is crucial to maintain control over the system's pressures and vessel levels.

The need for multiple pressurisations is driven by various reasons, such as:

- Improved load distribution: Distributing load for better partial load behaviour.
- Enhanced safety: Increasing operational safety.
- Full safety: Redundancy in all components and performance.
- Maximum ease of maintenance: maintaining pressurisation during maintenance work on the device or expansion vessels.
- Space optimization: Overcoming limitations due to insufficient space.
- Volume recirculation: energy-efficient recirculation of displaced water volumes in heating-cooling change-over systems with common consumers.
- Integration of installations: Merging existing installations for a comprehensive system.
- Temporary autonomous operation: Enabling independent operation in hydraulic networks, as in local heating systems with secondary district decoupling.

In order to fulfil the requirements described above, different master-slave operating modes are required.

MS-PC

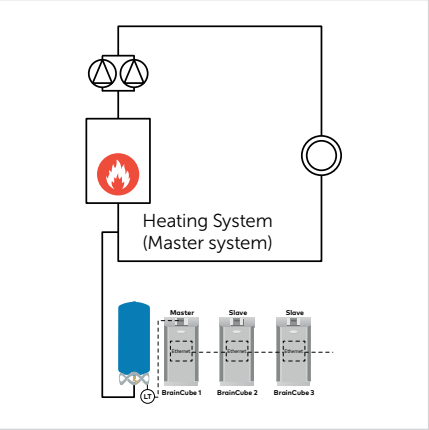
(Master-Slave Pressure Control)

Multiple pressurisation stations in parallel for:
Improved load distribution + Enhanced safety.

In this operating mode, all devices regulate with the same ACTUAL pressure value to individually adjustable setpoints. This ensures that the devices reliably fulfil their pressure maintenance function without causing mutual build-up.

The devices can have different pressure switch-on points and individual time delays for switching on their pumps and valves.

Pump running times can also be synchronised with each other. In this way, cascade operation with optimum partial load behaviour can be implemented and individual devices or even device groups can be defined as reserve or peak load devices, which can be switched on as new devices when required without any previous component stress or wear.



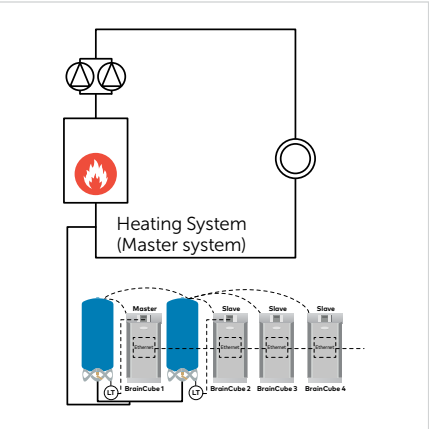
MS-PCR

(Master-Slave Pressure Control Redundancy)

Multiple pressurisation stations in parallel for:
Improved load distribution + Full safety + Maximum ease of maintenance.

MS-PCR operation is an extended MS-PC operation. Each device can achieve full redundancy of the components by analysing its own measuring foot LT on its own expansion vessel. Depending on the design of the devices, full redundancy of the pressurisation capacity can also be achieved.

If additional expansion vessels with their own measuring feet are used, redundancy is also achieved for the expansion volume and at the same time the pressurisation operation is fully maintained during service and maintenance work.

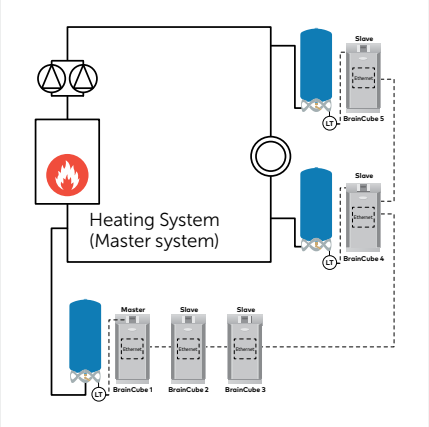


MS-LC

(Master-Slave Level Control)

Two or more pressurisation stations at different locations within a single system for:
Space optimisation (+ Volume recirculation + Integration of installations + Temporary autonomous operation).

MS-LC master-slave operation is always required if several pressurisations with their own expansion vessels are integrated at different points in the system or if the expansion vessels of the pressurisations do not automatically balance their water level via the principle of communicating water columns.

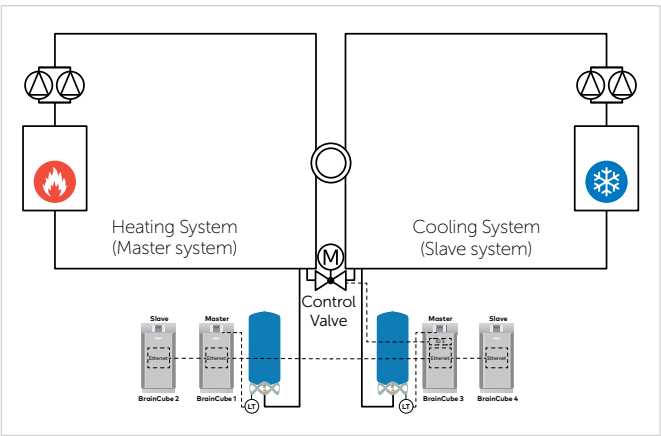


MS-IO

(Master-Slave Isolated Operation)

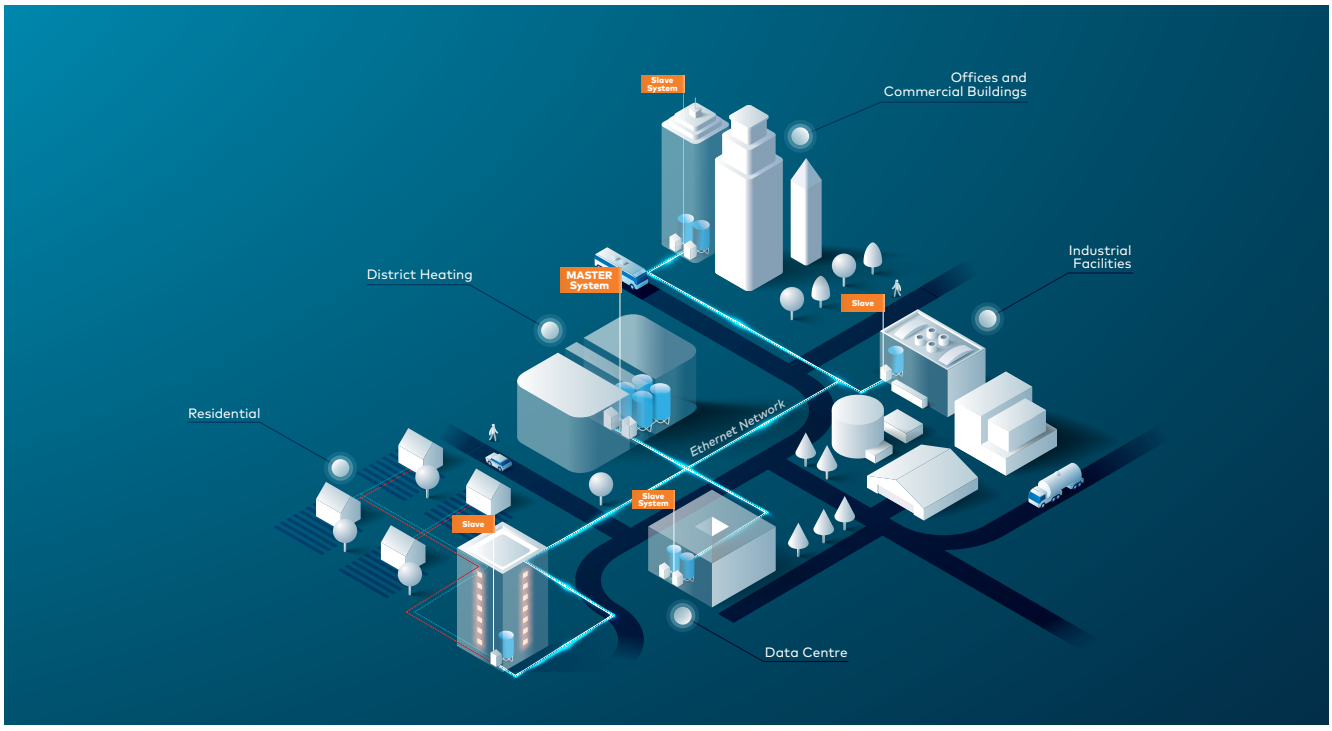
Two or more independent pressurisation stations in separate but connectable systems:
Volume recirculation + Integration of installations + Temporary autonomous operation.

MS-IO master-slave operation is always required when several pressurisations in different systems, which can be either hydraulically separated or connected, have to work together. If the systems are hydraulically separated from each other, the pressurisations work in MS-IO mode and maintain the pressure in your system (pressure control). If two systems are hydraulically connected to each other, the operating mode of one system switches to LC (Level Control) mode. Switching between the operating modes can be controlled automatically via the pressurisation stations themselves or via the BMS.



BrainCube Connect MS Communication via Ethernet-Multicast

In demanding applications like district heating and/or cooling, especially where multiple sub-power plants are situated several kilometres apart in addition to the main thermal power plant, the Master-Slave communication via **Ethernet-Multicast is the optimal solution**. It eliminates the need for additional cabling and efficiently utilizes existing Ethernet network infrastructure, whether dedicated or public.



Master-Slave communication via Ethernet-Multicast network.

Efficient integration

- **No additional cabling needed:** Multicast communication via Ethernet eliminates extensive additional cabling requirements.
- **Utilizes existing networks:** Leverages existing network infrastructure effectively.
- For master-slave combined operations, IMI Pneumatex offers two options: RS485 with Modbus RTU protocol or Ethernet with the innovative multicast technology.

IMI Pneumatex Master-Slave operation with Ethernet-Multicast communication

- **Independent operation:** Multiple master-slave network systems can operate independently in an Ethernet network using the multicast communication.
- **Controlled configuration:** Configuration is managed through multicast port numbers.

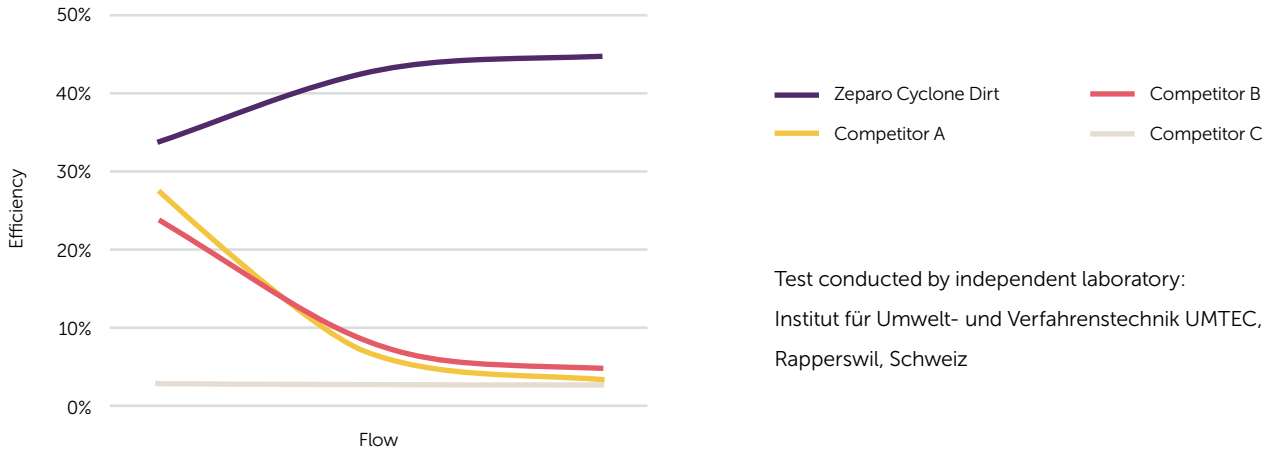
Each individual Ethernet network system can be operated with up to 40 devices with a common multicast IP and port. Using different multicast port numbers allows multiple Master-Slave networks (up to 40 units each) to operate independently within an Ethernet network for enhanced flexibility.

Cyclonic technology

The new standard in dirt and magnetite separation revolutionizes HVAC maintenance with efficiency up to 9 times higher.

Proof of performance

Measured Separation Efficiency against Competitors

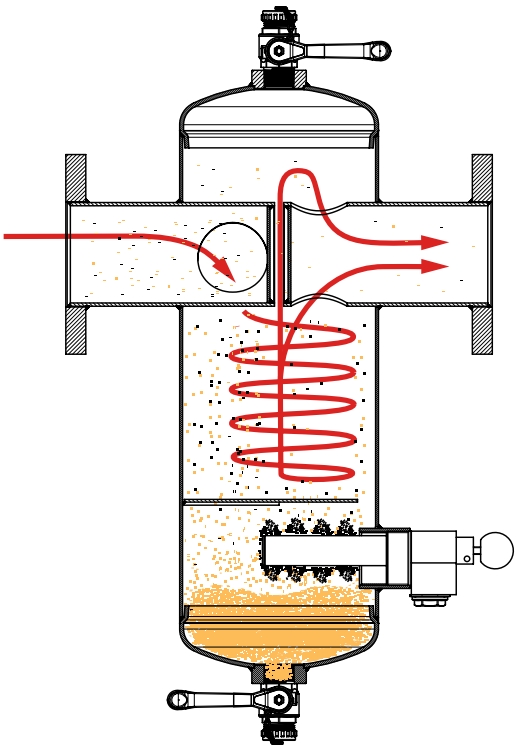


Test conducted by independent laboratory:
Institut für Umwelt- und Verfahrenstechnik UMTEC, Rapperswil, Schweiz

WATCH THE VIDEO

Learn more about Zeparo Cyclone Max and its ability to achieve up to 95% dirt separation in a single cycle, regardless of water speed or pipe size.

The Cyclonic principle



- A water vortex exerts a centrifugal force on dirt particles and thrusts them against the separator's outer wall
- The lower velocity at the edge of the cyclone allows gravity to move the particles to the bottom of the separator
- A retarding plate at the bottom ensures the dirt participles remain captured in the chamber until they are disposed of

Your benefits:

- Our new cyclonic technology is the only one that reliably eliminates up to 95% of dirt in a single cycle*
- Working at all water speeds and pipe sizes: high efficiency independent of dimension or water speeds
- Suitable for system temperatures up to 110 °C thanks to a special compound (PPS) used for inner parts
- Flexible installation in horizontal and vertical position
- Inline construction for easy installation and maintenance
- Even the smallest particles (5-10 µm), usually responsible for the most serious damages, can be captured thanks to the strongest magnet in the dirt separators market
- Save from 3% to 7% on primary energy consumption**

*depending on particle sizes, 200-800 µm measured

** starting from the third year, visit our website for more details: https://uqr.to/energy-facts

Helistill technology

Achieve the highest separation efficiency in low flow conditions thanks to the Helistill technology.

During the sedimentation process, the flow slows down along with the dirt particles entering the Zeparo chamber. Some particles start to fall due to gravity and the remaining ones bump into the helistill insert and consequentially fall down as well.

WATCH THE VIDEO

Learn more about Zeparo ZT Turnable and its extreme installation flexibility.

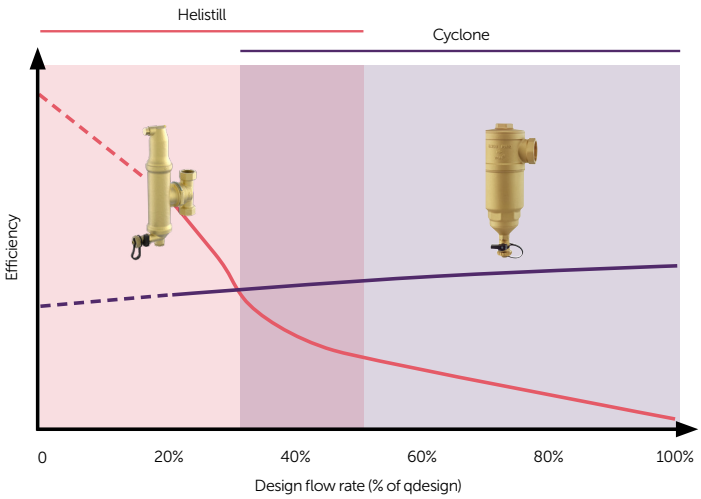
The Helistill principle

The Zeparo's separators range is equipped with helistill technology.

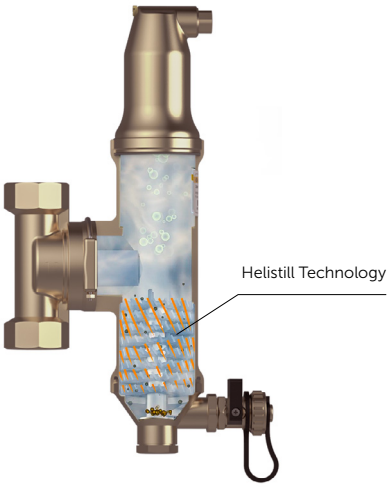
The shape of the helistill insert is ideal for catching the micro-bubbles and dirt particles so that they can be effectively separated from the water and subsequently flushed into a container, away from the flow turbulence.

HELI stands for helical and indicates the tangential dynamics in the separation process.
STILL indicates the stillness required for the defined separation of gaseous and solid components.

Find out which technology is the most suitable for you



Zeparo ZT Turnable

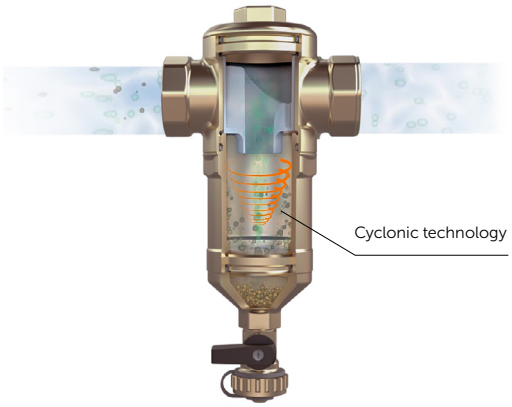


For applications where for most of the season, the flow rate is **low (15-20% of q_{design}), Zeparo ZT turnable** is the best choice because the lower the speed, the higher the efficiency.

For applications where for most of the season, the flow rate is **above 70% of q_{design}**, the cyclonic technology, and therefore **Zeparo Cyclone**, is the best choice because from that limit and over it the separation efficiency is up to **9 times larger** than with sedimentation process.

In the area of around between 30%-50% of q_{design} it is possible to use both the technologies with a good result.

Zeparo Cyclone



Cyclonic vacuum degassing

The ultimate in gas removal technology, packed in a compact yet high-performant design to meet the requirements of today's complex HVAC systems.

Problems linked to dissolved gases occur mostly during installation, as the fresh water put in the system contains air. However, there are other installations where gases may persist:

- cooling systems;
- systems generating gases on a continuous basis, such as large-scale and/or older installations, as well as systems featuring plastic piping;
- wherever substantial quantities of water are added e.g. due to system extension.

With these application scenarios in mind, IMI Pneumatex developed a highly efficient technology now known as cyclonic vacuum degassing. The cyclonic effect allows free gases to concentrate in the center of the cyclone where they can combine into larger bubbles. The water is then vacuum-purged in the degassing chamber.

WATCH THE VIDEO

Learn more about Vento Connect cyclonic vacuum degasser

Simply Vento & Vento Compact

- Compact and efficient degassing unit
- Easy to install and commission thanks to the plug and play installation
- Vento compact includes Eco mode and automatic and direct degassing of make-up water

Vento Connect

At least 50% more efficient than most other vacuum degassing systems currently on the market

- Offers energy and water savings
- Direct degassing of make-up water: additional protection against corrosion

Cyclonic vacuum degassing is used in both the Vento and Transfero TV/TVI Connect ranges.

Magnets

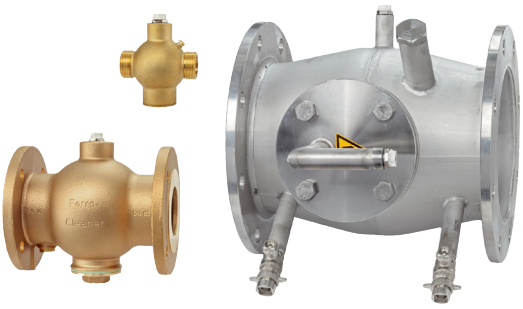
The IMI Pneumatex magnetic flow filtration systems which combines an extremely strong magnet with an integrated magnesium sacrificial anode to reduce oxygen in plant water.

Metallic materials, such as steel or iron, react with oxygen.
This reaction is called corrosion and results in the creation of magnetite and rust that travels in the HVAC system as it operates.

The effects of magnetite in heating systems can:

- Have a negative influence on the heat transfer of heat generators and heat delivery points
- Damage to valve spindles and seals
- Blockage, storage and sliding ring damage from pumps
- Influencing heat meters
- Rapidly polluting dirt catchers and filters

By removing even the smallest elements of magnetite, the life cycle of the critical systems is prolonged.



Ferro-Cleaner

Magnetic rod with magnetite in a Zeparo dirt separator

Ferro Cleaner magnet after 1 year of operation

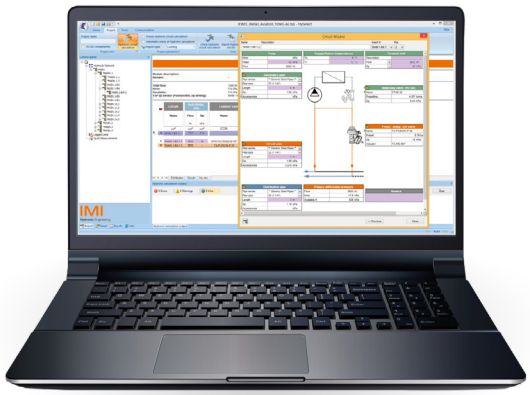
Software & Apps

Our selection of Planning & Calculation tools take the guesswork out of system planning, making it the ideal complement to our product range.

HySelect

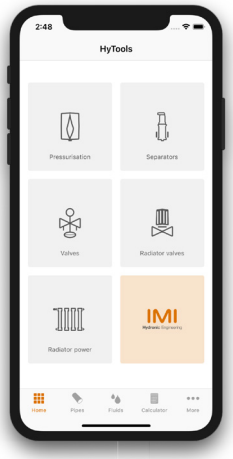
Everything you need to design, optimise and control a hydronic system in one software. HySelect helps you create and control your hydronic system from the design stage right through to commissioning. You can simply draft an optimal system layout by entering pipe lengths, the design flow of terminal units, as well as differential pressure values.
HySelect is the perfect tool to complement, but not replace, the expertise of our sales teams. So get in touch with them to discover how our HySelect software and our long history of industry expertise can help you create world-beating hydronic installations.

Download the HySelect software from our website



HyTools

All-in-one app for hydronic calculations.
HyTools is packed with expert hydronic data to simplify complex calculations and product selection. Achieving ideal system balancing, optimal pressurisation and energy-efficient is just a few clicks away with your smartphone.



HyTools is available from the App Store or Google Play

Download on the App Store

Unique performance, innovative technology

High-quality materials, expert support and tried&tested technologies ensure our all-encompassing rangeof solutions help you meet every 21st Century challenge.

"As IMI Pneumatex is leading innovation, we're always among the first to learn about the latest trends."

Gerhard Heiling, Austria

Sharing our knowledge

As a customer-focused business with decades of experience and involvement in over 100,000 major worldwide projects, we have amassed a great wealth of knowledge that we are committed to sharing with you.

Customer Training and Seminars.
Our Hydronic College teams located across the globe have helped over 200,000 HVAC professionals to gain insight into our products and acquire practical experience thanks to proficient seminars and training.

Customer partnership.
Thanks to our strong on-site experience we have the know-how to support you in any challenge you might face. **We work with you from the design stage all the way to the final commissioning to help create and maintain compliant, sustainable and highly efficient HVAC installations.**

"I really appreciate the design support and technical advice from my sales rep"
